Open dialogue and screening are essential for the adequate assessment of postpartum depression (PPD) in women who have recently given birth. However, the social stigma related to PPD may leave many women too afraid to speak up.

The following sample questions can help start the conversation with patients and their loved ones about PPD symptoms and uncover risk factors. These questions are meant to supplement formal screening with a standardized tool.

**CONSIDER ASKING ABOUT RISK FACTORS**

- Do you have a history of depression, trauma, or anxiety?
- Do you have a strong support system to help you with your baby?
- Do you feel supported by your spouse or partner?
- Are you experiencing overwhelming financial stress?

**CONSIDER DISCUSSING MOOD AND LIFESTYLE CHANGES POSTDELIVERY**

- Have you been crying or feeling sad more often than usual?
- Do you have trouble falling asleep or staying asleep?
- Have you been oversleeping or unable to sleep when the baby is asleep?
- How has your appetite changed? Are you eating much more or much less than you did before your baby was born?
- Have you been feeling moody, irritable, or restless?
- Have you lost interest in activities that were usually enjoyable?
- Would you say that you experience ongoing stress?

**CONSIDER ASKING ABOUT THE MOTHER-INFANT RELATIONSHIP AND ROLE TRANSITION**

- Do you have any doubts about your ability to care for your baby?
- Are you having trouble bonding with your baby?
- Have you ever thought about harming yourself or your baby?
Stress may contribute to the development of PPD. Providing social support for the mother whenever possible may help. 4

A mother with PPD may feel guilty or ashamed. Try to listen without judgment and allow your partner to discuss her feelings openly. 12

Lack of sleep can contribute to PPD. Help the new mother sleep more by contributing more to the household and childcare responsibilities. 13
