TOTAL SCORE

ABOUT POSTPARTUM DEPRESSION

It is estimated that postpartum depression (PPD) affects approximately 1 in 9 new mothers in the US annually. Unaddressed PPD can have harmful, long-term effects on mothers, their babies, and their family members.2-4

BE PREPARED

Consider screening your patients at multiple time points:

PRIOR TO DELIVERY

Onset of PPD symptoms can occur during pregnancy.4

POSTDELIVERY

Consider administering the EPDS or another validated screening tool between 2 and 3 weeks after childbirth.11

DURING POSTNATAL FOLLOW-UP

The American College of Obstetricians and Gynecologists (ACOG) recommends continued support as needed with a comprehensive visit no later than 12 weeks after birth.11

The American Academy of Pediatrics recommends integrating PPD screening and surveillance at the 1-, 2-, 4-, and 6-month well-child visits.12,13

If PPD is not addressed, symptoms may persist for months or up to a year.2,14,15

ABOUT THE EPDS AND INSTRUCTIONS FOR USE

The EPDS questionnaire asks women to self-report their experiences in the last week using 10 simple questions. After your patient has answered all 10 questions, total the answers to calculate the EPDS score.

SCORING

INTERPRETING EPDS SCORE

A woman scoring 12/13 or above is most likely suffering from depression in the peripartum period. Data suggest that lowering the threshold to a score of 9/10 may increase the detection of symptoms of PPD. Women screening positive for symptoms of PPD should be further assessed by a healthcare provider to confirm whether or not clinical depression is present. Screening tools are not a substitute for this clinical assessment, and scores just below the cutoff should not be taken to indicate the absence of depression, especially if the healthcare provider has other reasons to consider this diagnosis.16

Any woman answering the self-harm question affirmatively should be referred to a psychiatrist immediately.17
